REPORT SUMMARY

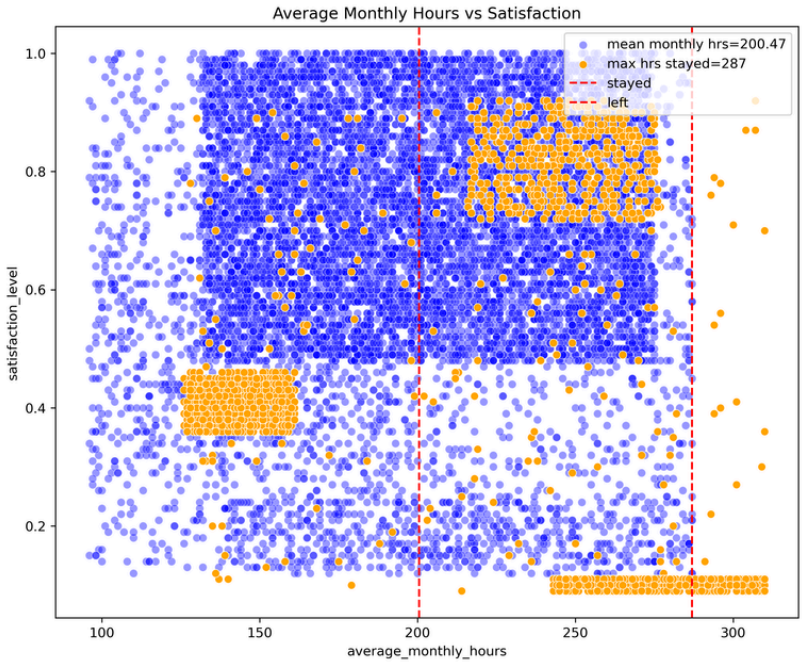
SALIFORT MOTORS EMPLOYEE TURNOVER PREDICTION

Problem

Salifort Motors seeks to reduce employee leaving and determine the causes the makes an employee leave the company

Analysis

A Random Forest Classification Model was built to predict the employee turnover using Salifort Motors HR Data



Results

The model performed great on evaluation meaning that it is able to predict whether or not an employee will leave.

The most influential features that help predict employee leaving are number of projects, monthly hours of work, and tenure.

Key Insights

01

Clusters of employee who left:

- Low performing employees given only 2 projects and on their 3rd year
- 5th year employees with high performance and satisfaction
- Dissatisfied employees who are high performers and overworked with largest hours and 6-7 projects

02

Optimum number of projects for an employee is 3-5. All employee with 7 projects left.

Employees who worked significantly more hours than their fellow with the same number of projects are more likely to leave.

03

Employee leaving is affected by salary where the lower the salary bracket, the higher the percentage of employee leaving.

Percentage of employee leaving per department have no huge differences.
